

Email Analysis Report – OnePlus Impersonation Assessment

On 2025-07-31 08:15:51 UTC, an incoming email was received by inquiry@mydfir.com. The message passed SPF and DKIM checks and was not marked as spam. A missing Date header is a suspicious indicator, as legitimate email clients typically include this field.

The domain daum[.]net belongs to a legitimate Korean email provider and was registered in 1996. DNS records and authentication results confirm that the message was sent through valid Daum/Kakao mail infrastructure.

Header analysis indicates the likely originating IP was 148[.]251[.]215[.]148. Current security vendor data does not classify this IP as malicious.

However, official communication for OnePlus would be expected to originate from oneplus[.]com or an authorized corporate domain. The use of oneplus.pr@daum.net strongly suggests the sender is not officially affiliated with the organization.

Content analysis reveals several social engineering indicators:

- Generic greeting
- Informal / mass-outreach writing style
- No personalized references
- No verifiable corporate signature
- No attachments or links were present in the message

Verdict

Likely unofficial or impersonating brand outreach. The email was technically legitimate in delivery, but the sender identity does not align with official communication channels.
